                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the antihypertensive effect of compounds. The present sequence is human alpha-2B-adrenoceptor variant.
                                                                                                                                                                                                                                                                                                                                                                                                               Human alpha-2BAR third intracellular loop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAM52117;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             297
```

The present sequence is human alpha2B-adrenoceptor (alpha2B-AR) protein. Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino acids (amino acids 294-311), located in the third intracellular loop of the receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polypeptide. Alpha2B-AR gene is located on chromosome 2. Alpha2-AR mediate many of the physiological effects of the catecholamines, noreplaephrine and epinephrine. An antagonist of alpha2B-adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries which is clinically expressed as coronary heat disease (CHD), unstable chronic angina pectoris which is clinically expressed as prinzmetal's variant form or acute myocardial infarction (AMI).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for detecting a risk of hypertension by determining the pattern of alleles encoding a variant alpha-2B-adrenoceptor (AR) protein. The methods and compositions of the invention are useful for detecting risks and targeting treatment for hypertension. The kit is also useful for selecting for clinical drug trials testing the antihypertensive effect of compounds. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting a risk of hypertension and targeting
by determining the pattern of alleles encoding

The present invention describes antigenic peptides (I) comprising:

(C) (a) any one of 1601 sequences (see ABBR2019) to ABP83619) of 12-24 amino (C) (a) any one of 1601 sequences (see ABBR2019) to ABP83619) of 12-24 amino (C) (a) an isolated (1) an assay for the detection of a particular (C) and (2) an isolated antibody having high specificity and high affinity (C) are avidity for a particular GPCR. (I) can be used as GPCR modulators and (2) an isolated antibody having high specificity and high affinity (C) an antibody against a particular GPCR, and in the production of specific antibodies. The apprince of corresponding GPCRs are useful in detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing drugs for treating immune-related diseases, growth-related diseases, cell cregeneration-related diseases, growth-related dell proliferative diseases, or autoimmune diseases, e.g. AIDS, Alzheimer's disease, atherosclerosis, bacterial, fungal, procozoan or viral infections, atherosclerosis, bacterial, fungal, procozoan or viral infections, costacatthritis, osteoporossis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, diabetes, graft versus host (disease, parkinson's disease, multiple sclerosis, pain, psoriasis, memory loss, epilepsy, asthma, tuberculosis, obesity, nausea, hypertension, or ther offices are involved. The antibodies may be used in immunoassays and immunodiagnosis, ABZ42523 to ABZ4269 encode (C) epcR proteins given in ABB91675 to ABB92018, which are used in the
                                                                                                                                                                                                                                                                                                                                                                          Matches

Human alpha-2B adrenergic receptor (AAWi1804) is a member of the rhodopsin-like signal transducer family. Its amino acid sequence was deduced from a genomic DNA clone (AAT59499) obtd. from a human spleen DNA library. Vectors have been adapted to allow prodn. of
                                                                                                                                                            Assay

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               alpha-2B adrenoceptor in bacterial, yeast or mammalian cells; transfected Ltk- cells, designated L-NGC-alpha-2B, are deposited ATCC CRL 10275. Membranes of transfected mammalian cells can use in novel methods to identify drugs which specifically interact with, and bind to, the alpha-2B adrenergic receptor. (Updated on 25-MAR-2003 to correct PF field.)

The receptor proteins were used to design polypeptides, pref. based on the binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR such as binding a GPR ligand or modulating GPR ligand binding to a GPR compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Proteins AAW02657-W02720 represent a range of G-protein coupled receptor (GGR) proteins selected from cAMP, adenosine, muscarinic acetylcholine, adrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin, were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. GPR ligand or modulating GPR ligand activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see hAW02747-W0299) for examples of polypeptide fragments can be used in compositions for treating subjects suffering such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

CC The invention relates to genotyping an alpha-2B, 2A, or 2C adrenergic CC receptor gene (I)-(III) by detecting a polymorphic site, comprising; CC (a) obtaining a sample having a polymorphic site comprising; CC alpha2A or alpha2C or fragment or complement of; and CC (b) detecting a polymorphic site comprising mucleotide position 73 of (IIV) CC or a site comprising (ytosine or guanine at position 75 of (IIV) CC or a site comprising (A) (ggggggggg) or (B) (gggggggtgga) at CC (positions 961-972 of (III). The method may be used for genotyping an CC alpha2B, alpha2A or alpha2C receptor gene and further used to determine CC whether an individual is at increased risk of developing a disease associated with alpha2B, alpha2A or alpha2, comprising detecting a CC polymorphic site which correlate to disease selected from cardiovascular CC disease, central nervous system disease and combinations of these. In CC addition, the technique may be used to predict an individual's response to an alpha2B, alpha2A, or alpha2C agonist (e.g. epinephrine, CC combinations of these) or antagonist (e.g. epinephrine, CC combinations of these) or antagonist (e.g. yohimbine, prazosin, ARC 239, CC ralwelscine, idazoxan, tolazoline, phentolamine and combinations of completermined response (where the response is correlated to adenyly) and CC curlates. May kinsee activity, phosphorylation or inosital phosphafe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to genotyping an alpha-2B, 2A, or 2C adrenergic CC receptor gene (I)-(III) by detecting a polymorphic site, comprising; CC (a) obtaining a sample having a polymucleotide encoding an alpha-2B, CC (a) phazA or alpha2C or fragment or complement of; and (b) detecting a polymorphic site comprising nucleotide positions 901-909 (CC of (I), a site comprising cytosine or guanine at position 753 of (IIV) (CC or a site comprising (A)) (ggggcgggcg) or (B) (ggggggggdgdg) at (CC positions 961-972 of (III). The method may be used for genotyping an alpha2B, alpha2A or alpha2C receptor gene and further used to determine (CC alpha2B, alpha2A) at increased risk of developing a disease comprising elected with alpha2B, alpha2A or alpha2, comprising detecting a glymorphic site which correlate to disease selected from cardiovascular (CC polymorphic site which correlate to disease and combinations of these. In (CC disease, central nervous system disease and combinations of these. In (CC combinations of these) or antagonist (e.g. epinephrine, prazosin, ARC 239, crauwolscine, idazoxan, tolazoline, phentolamine and combinations of these) or antagonist (e.g. yohimbine, prazosin, ARC 239, crauwolscine, idazoxan, tolazoline, phentolamine and combinations of these) by detecting the polymorphic site and correlated to adenylyl (cc cyclase, MAP kinase activity, phosphorylation or inositol phosphate (cc levels). The present sequence is that of the human alpha-2AAR protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The present invention describes antigenic peptides (I) comprising:

(C (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino completed: (I) an assay for the detection of a particular completed: (I) an assay for the detection of a particular completed: (I) an assay for the detection of a particular completed: (I) can be used as GPCR modulators and (2) an isolated antibody having high specificity and high affinity completed: (I) can be used as GPCR modulators and completed: (I) can be used as GPCR modulators and completed: (I) can be used as GPCR modulators and completed: (I) can be used as GPCR modulators and completed: (I) can be used as GPCR modulators and completed: (I) can be used as GPCR modulators and completed: (I) can antibodies. The peptides and antibodies are also useful for detecting the complete completed: (I) can be useful for detecting the complete completed: (I) can be useful for detecting the complete completed: (I) can be useful for designing drugs for complete completed: (I) can be useful for diseases, cell completed: (I) can be useful for diseases, cell completed: (I) can be useful for diseases, completed: (I) can be useful for diseases, cell completed: (I) can be useful for diseases, can be useful for diseases, can be useful for diseases, can be useful for diseases, can be useful for complete co osteoarthritis, osteoporosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, diabetes, graft versus host disease, Parkinson's disease, multiple sclerosis, pain, psoriasis, anxiety, depression, schizophrenia, dementia, mental retardation, memory loss, epilepsy, asthma, tuberculosis, obesity, nausea, hypertension, hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be used in immunoassays and immunodiagnosis, ABZ4253 to ABZ42869 encode GPCR proteins given in ABPB1675 to ABB82018, which are used in the ō, the present

CC alpha2A or alpha2C or fragment or complement of; and CC (b) detecting a polymorphic site complement of; and CC (c) detecting a polymorphic site complement of; and CC of (I), a site comprising cytosine or guanine at positions 901-909 CC or a site comprising (A) (ggggggggcg) or (B) (ggggggggtggg) at CC opsitions 961-972 of (III). The method may be used for genotyping an CC alpha2B, alpha2A or alpha2C receptor gene and further used to determine CC whether an individual is at increased risk of developing a disease CC associated with alpha2B, alpha2A or alpha2, comprising detecting a CC polymorphic site which correlate to disease selected from cardiovascular CC disease, central nervous system disease and combinations of these. In CC addition, the technique may be used to predict an individual's response CC norepinephrine, clonidine, oxymetazoline, guanabenz, UR14304, BHT933 and CC combinations of these) or antagonist (e.g. whimbine, prazosin, ARC 239, CT rauwolscine, idazoxan, tolazoline, phentolamine and combinations of these by detecting the polymorphic site and correlating the site to a predetermined response (where the response is correlated to adenylyl CC cyclase, MAP kinase activity, phosphorylation or inositol phosphate CC levels). The present sequence is that of the human alpha-2CAR variant CC protein, deleted for a 4 amino acid polymorphic site at residues 321-324 of the wildtype protein (AAMS2124).
